

## **H3C WA6126 New Generation Access Point**

**802.11ax Indoor Series Access Point** 

Release Date: Aug 2022

New H3C Technologies Co., Limited

# H3C WA6126 Wi-Fi 6 (802.11ax) Indoor Wireless Access Point

#### Overview

H3C WA6126 is a Wi-Fi 6 (802.11ax) access point (AP) individually developed by New H3C Technologies Co., Ltd. (H3C). The AP adopts a dual-band and six-stream design with a maximum access rate of 5.375 Gbps. For 5 GHz radio 4 spatial streams, the maximum negotiation rate is 4.8 Gbps. For 2.4 GHz radio 2 spatial streams, the maximum negotiation rate is 0.575 Gbps. It meets the high bandwidth and high concurrency requirements of common high-density indoor scenarios.

The installation of H3C WA6126 wireless AP is flexible, with panel mounting, wall mounting, and ceiling mounting available. The dual network port design enables link aggregation and internal and external network isolation.

WA6126 Wi-Fi 6 (802.11ax) wireless AP

#### **Product features**

### Operating mode

#### Fit AP mode

The WA6126 supports the Fit AP mode and can be managed by the wireless controller equipped with the Comware system. In this networking mode, the user can locally manage the APs in batches.

#### Cloud AP mode

WA6126 supports H3C Cloudnet solution that enables wireless networking without hardware AC and

authentication server. It can perform authentications via PPSK, PSK, Portal, SMS, and WeChat. Customized development is implemented for multi-branch scenarios such as hotel chains and supermarkets, enabling features such as easy deployment, hierarchical and decentralized management, smart large screen at headquarters, and customized configuration templates. The Cloudnet smart O&M platform enables users to grasp the status of wireless devices, networks, and terminal devices, and allows for simple management and O&M. This helps to reduce customer capital investment and O&M labor costs, and increase efficiency.

WA6126 supports Quicknet local automatic networking solution. Automatic discovery and construction of devices to achieve unified management of multiple devices and ensure network experience by relying on AP intelligent native technology.

#### Smart O&M

The visualized, measurable, and auto-optimized H3C smart O&M system facilitates operation and maintenance and saves labor costs.

#### Data visualization

The H3C smart O&M system collects and displays rich O&M data via telemetry techniques. On the terminal side, it records the terminal's roaming log, authentication log, signal strength, important packet interaction log, packet loss, latency, etc., and can identify over 150 reasons for terminal failures to go online, over 140 reasons for terminals to go offline, and over 100 reasons for authentication failures. On the AP side, it collects data such as AP association failures, reasons for detaching from the AC, traffic composition of each wired interface, error packet information, radio traffic composition, radio channel utilization, radio interference strength, and WIPS wireless attacks.

#### Measurability

The H3C smart O&M system has established a perfect evaluation system to measure the user experience, device health status, and network status, enabling the administrators to view and maintain the network easily.

#### **Automatic optimization**

The changing wireless network, radio environment, services, and user scale require the network to have the ability of automatic issue resolving and network optimization. The H3C smart O&M system features intelligent and progressive optimization. It can identify and analyze network issues automatically, and deliver policies for automatic issue resolving and network optimization. In this way, the network will always have high performance, low interference, and optimal user experience without human interference.

### Security protection of wired and wireless networks

#### Terminal device access and admission security

With the wireless controller, wireless switches, and authentication system self-developed by H3C, WA6126 can support authentication and encryption via 802.1x, PSK, MAC address, PPPoE, Portal, WeChat, and SMS. This ensures network security.

#### Wireless intrusion prevention system (WIPS)

WA6126 supports WIPS. In combination with the wireless controller/wireless switch, it supports WIPS features such as detection, intrusion detection, as well as blacklist and whitelist of rogue devices at the same time. The WIPS features enable the device to detect, identify, take countermeasures against, and effectively intercept rogue devices.

#### Wired network security

WA6126 supports wired access and control of APs. The wireless port of APs can be authenticated as an 802.1X client of the wired access network to ensure the legality of the AP. It guarantees the security of the wireless tunnel through encryption methods such as CAPWAP tunnel and DTLS.

Wired network security can be enhanced with the H3C Security Situational Awareness. When the wired terminal detects a security issue in the wireless terminal, a linkage mechanism will be triggered to notify the wireless controller to block the wireless access of the terminal, thereby ensuring network security.

#### Radio resource optimization and station access control policy

WA6126 supports the radio resource optimization policy (RROP). RROP is a collection of multiple wireless radio optimization methods. It is used to reduce or control the consumption of radio media resources caused by management packets, broadcast packets, and invalid packets. It helps to set aside more resources to provide the users with better wireless application services. RROP mainly contains radio resource optimization policies such as layer 2 isolation for wireless services, disabling low data rate, adjusting the Beacon interval, and disabling the broadcast probe function.

WA6126 supports the station access control policy (SACP), which guides the terminal client to access the optimal AP or wireless service and helps control and schedule the traffic of the terminal devices based on network applications. This improves the overall performance of the entire wireless network and improves the experience and effect of wireless access applications. SACP feature mainly includes terminal control policies such as the prohibition of clients with weak signals, spectrum guide, roaming guide, load sharing, ignorance of packets with weak signals, fair scheduling of radios, traffic shaping based on client link status, and smart bandwidth guarantee.

#### Radio resource management (RRM)

RRM monitors in real time the environmental conditions such as the utilization rate of radio channels, channel interference, and signal conflict through systematic intelligent radio management. Moreover, it adjusts in real time the radio parameters such as the working channel, bandwidth, and power to maintain optimal radio resource status. In this way, it enables auto network planning and auto network repair.

#### Roaming optimization

The wireless AP supports the fast BSS transition feature defined in the 802.11r standard that helps to facilitate the roaming of wireless users, reduce the possibility of network interruptions, and enhance roaming quality.

Through the 802.11k mechanism, the AP and the wireless client perform interactive detection and perceive multi-dimensional network topologies. The AC identifies and comprehensively calculates the roaming timing and access location of the wireless client from a full perspective and negotiates switching with the client via the 802.11v and 802.11r mechanisms. During the switching period, the AC will ensure the traffic of the downlink service, to achieve seamless switching and improve user experience.

#### Only 11ax access

WA6126 supports the only 11ax access feature. The Wi-Fi 6 (802.11ax) is backward-compatible with 802.11a/b/g/n/ac standard, so the users of the 802.11a/b/g/n/ac standard can access a Wi-Fi 6 (802.11ax) wireless access device. However, its compatibility causes a decline in the actual performance of devices with high access capabilities such as Wi-Fi 6 (802.11ax) to some extent. H3C devices enable the user to set the access mode of a certain radio frequency to only 11ax (only users using Wi-Fi 6 (802.11ax) can access). This ensures bandwidth transmission and device performance.

#### Orthogonal frequency division multiple access (OFDMA)

WA6126 supports OFDMA technology. An AP can divide wireless bandwidth and transmit data to multiple terminals simultaneously via different subcarriers. This reduces transmission latency caused by multi-user radio resource contention and backoffs and improves the user experience of low-latency applications such as speech output and video in multi-user scenarios.

## Spatial reuse (SR)

WA6126 supports spatial reuse technology and basic service set (BSS) coloring technology. With these technologies, it identifies the color of the packets at the link layer to control the terminal device and adjusts transmit power to improve the reuse rate of channels in high-density deployment and avoid co-channel interference in case of simultaneous multi-user operation. This greatly improves the utilization rate of spectrum resources.

## Orthogonal frequency division multiple access (TWT)

WA6126 supports the target wake times (TWT) technology. It allows the AP to uniformly schedule the wakeup and sleep time of the terminal, reducing contention and improving power efficiency by decreasing unnecessary wake-up times of the terminal.

#### Flexible forwarding

When the WA6126 AP is connected via a wide area network (WAN), the wireless access points (AP) are deployed in branch offices, while wireless access controllers (AC) are deployed in headquarters. In the traditional forwarding mode, all packets are sent from APs to ACs, and centrally forwarded by the AC. However, for WA6126, the packets can be converted to wired packets on the wireless access device directly avoiding data packets sent through AC but forwarded locally, which significantly saves wired network

bandwidth. Besides, WA6126 supports flexible policy-based forwarding and allows terminal devices of the same wireless service to implement centralized forwarding and local forwarding, so as to release export bandwidth and save costs of network bandwidth.

#### IPv4 and IPv6 dual stack (Native IPv6)

WA6126 is fully compliant with IPv6 and implements dual IPv4/IPv6 protocol stacks. It can automatically register on the wireless controller and provide wireless services no matter in an IPv4 or IPv6 network via broadcast, multicast, DHCP option 43, or DNS, so that it never runs as an information silo.

#### End user admission domination

End user admission domination (EAD) integrates network access and terminal security products, and implements enterprise security policies for user terminals that have accessed the network. When working with a security policy server, it can monitor users, remind, isolate, or boot them off when their systems are infected or not patched correctly. Only wireless clients that comply with security policies are admitted. This enhances overall wireless security.

## **Specifications**

## Hardware specifications

Name	WA6126		
Dimensions			
(excluding antenna			
connectors and	35 x 185 x 155 mm (H x W x D)		
mounting			
accessories)			
Ethernet interface	1 × 100/1000M/2.5G electrical port		
	1 × 100/1000M electrical port		
PoE	2.5GE: 802.3at/af		
Local power supply	upply 54V DC		
Console port	onsole port 1		
USB port	1		
Built-in antenna	Internal Omni-directional antenna		
	4dBi antenna gain @2.4GHz		
	4dBi antenna gain @5GHz		
	802.11ax/ac/n/a: 5.725 GHz - 5.850 GHz (China); 5.47 GHz - 5.725 GHz; 5.15		
Working frequencies	GHz - 5.35 GHz (China)		
	802.11ax/b/g/n: 2.4 GHz - 2.483 GHz (China)		

Name	WA6126	
	OFDM: BPSK@6/9Mbps, QPSK@12/18Mbps, 16-QAM@24Mbps, 64-	
	QAM@48/54Mbps	
Modulation	DSSS: DBPSK@1Mbps, DQPSK@2Mbps, CCK@5.5/11Mbps	
technology	MIMO-OFDM(11n): MCS 0-31	
	MIMO-OFDM(11ac): MCS 0-9	
	MIMO-OFDM(11ax): MCS 0-11	
	11b: DSS:CCK@5.5/11Mbps, DQPSK@2Mbps, DBPSK@1Mbps

MTBF	>850000H	

## Software specifications

Name		WA6126
Positioning		Indoor AP (5 GHz 4*4 MIMO + 2.4 GHz 2*2 MIMO)
Operating mode	Fit mode	Controlled by AC
	Cloud mode (Fat mode)	Controlled via Cloudnet or operates independently
	Mode switching	Mode switching via command lines, ACs, Cloudnet, or reset button
	Maximum Wi-Fi 6 (802.11ax) transmission speed	4.8 Gbps + 0.575 Gbps
11ax	TWT	Supported
supported	BSS Color	Supported
	MU-MIMO	Supported
	OFDMA	Supported
	Only 11ax	Supported
	Working frequencies	5 GHz + 2.4 GHz
	A-MPDU	Supported
	A-MSDU	Supported
	Maximum likelihood demodulation (MLD)	Supported
	Maximal ratio combining (MRC)	Supported
WLAN basics	Spatial-Time block coding (STBC)	Supported
	Low-density parity check (LDPC)	Supported
	Recommended number of clients	120
	Maximum number of SSID	8
WLAN extended	STA related	STA offline anomaly check, STA aging, statistics and status query
	User number limit	Supported
	Link integrity check	Supported

	Broadcast probe acknowledgment control	Supported
	Prohibition of client access with weak signals	Supported
	Hidden SSID	Supported
	WLAN RRM	Supported
	Wireless bridging	Supported
	Repeater mode	Supported
	11k	Supported
	11v	Available in Fit mode
	11r	Available in Fit mode
		TKIP, CCMP, WPA3, and WAPI
	Encryption	Multiple encryption key triggered dynamic unicast/multicast
		key update
	802.11i	Supported
		802.1X authentication, MAC address authentication, PSK
		authentication, Portal authentication;
	Authentication	Open system/shared key authentication;
		Enhanced open system authentication
		Mixed access of WPA, WPA2, WPA3, and Pre-RSNA users
		Layer 2 user isolation
Security	User isolation	SSID-based user isolation
control	Forwarding security	Packet filtering, MAC address filtering, and broadcast storm
policies	Forwarding security	suppression
	Wireless endpoint access	Wireless EAD supported
	SSID and VLAN	
	binding	Supported
	Wireless Intelligent	
	Application Aware	Supported
	(wIAA)	
	WIDS/WIPS	Supported
	MFP (802.11w)	Supported
	802.1X Client	Supported
AAA	Radius Client	Supported

	Multiple-domain	Supported
	authentication server	
	Backup authentication	Supported
	server	
	IP address	Static IP or DHCP assigned IP (option 60)
	configuration	Country of Error assigned in (option co)
	Native IPv6	Supported
Layer 2 and	IPv6 Portal	Supported
layer 3	IPv6 SAVI	Supported
features	ACL	IPv4/IPv6
leatures	NAT	Supported
	PPPoE Client	Supported
		Local forwarding based on SSID+VLAN supported in Fit
	Local forwarding	mode
	802.11e	WMM
		Ethernet port based 802.1p identification and marking
	Priority	priority
		Priority mapping for wired and wireless connection
	Strategic QoS mapping	Distinctive QoS policies based on individual SSID/VLAN
	Layer 2 to Layer 4	
	packet filtering and	Supported
	traffic classification	
	CAR	Supported
		Bandwidth allocation per STA
	User bandwidth	All STAs sharing bandwidth with a common SSID
QoS	management	Dynamical adjusting of the available bandwidth of the STAs
·		in terms of service needs
		Traffic-based load balancing
	Load balancing	User-based load balancing
		Radio-based load balancing for dual-5G devices
	Spectrum guide	Supported
	Multicast enhancement	Multicast to unicast (IPv4/IPv6)
	CAC (Call Admission	
	Control)	Session-based and channel usage-based CAC
	Application	Supports audio and video optimization (eMDI/SQA/UCC) in
	recognition	Fit mode
	1 3 ·	I .

Green features	Green AP mode	Supported	
	Dynamic MIMO power	Supported	
	saving	Supported	
	Enhanced automatic		
	power save delivery (E-	Supported	
	APSD)		
	SM Power Save	Supported	
	Centralized AC	Fit mode: supports centralized management	
	management	Cloud mode: supports version upgrade and mode switching	
Management and maintenance	Cloudnet management	Available in Cloud mode	
	Local Web	Available in Cloud mode	
	Telnet	Available in Cloud mode	
	SSH	Available in Cloud mode	
	Debug serial port	Supported	
	Smart O&M	Available in Fit/Cloud mode
